Here's one of the ingenious creations of Gavin Harper: the Band Aid Fuel Cell. The materials you'll need is inexpensive and easy to acquire. Following the instructions (thanks, Makezine) on how to make this is also very easy.

To build a band aid fuel cell, you'll need two big (plain) band aids - don't get the ones with aloe vera or any special ointment as this will mess up the project. You'll also need a stainless steel fly screen, preferably with a grade of 318 and with 72 wires per inch in both directions.

The MEA or the Membrane Electrode Assembly is the most important part of this fuel cell. You can choose to either make one from scratch or purchase one that's already been made. It's advisable to wear cotton gloves when making your band aid fuel cell.

Click on the link for the complete instructions.
